  - MMR (2)
  - Pox (2)
  - Tetanus (1)
- Physical Exam
- Behavioral Assessment
- Developmental Assessment
- Visual Acuity
- Blood Pressure
- Head Circumference
- Height & Weight
- History (initial or annual update)
EPDST means Early and Periodic Screening, Diagnosis, and Treatment and is the Federal program name for preventive health care for children (birth to 21) on Dental Kidcared and other Medicaid. This table represents the screening piece of EPDST not the diagnosis, treatment or follow-up.

Recommended for adolescents who are sexually active.

STD screenings are recommended for females beginning at 13 or earlier if sexually active. Pap smear is recommended for females beginning at 16 or earlier if sexually active.

Pregnant women are recommended to be screened for HIV at any time during pregnancy. All pregnant women should be offered HIV testing prior to first prenatal visit. If pregnant woman is receiving care in a prenatal clinic, she is offered HIV testing at each prenatal visit. Pregnant woman is offered HIV testing at each prenatal visit for all prenatal care except for those clinic that have a policy of not offering HIV testing.

In the schedule the star indicates the recommended age, however screening can occur at any age. WIC is a required referral for pregnant teen age 12 and who are on DCSC and Medicaid.

WIC is a required referral for children on Medicaid/Dental Kidcared from birth to five years of age.

Dental referrals required at 3 years of age or earlier if necessary.

In the schedule the star indicates the recommended age, however screening can occur at any age if indicated.

In the schedule the star indicates the recommended hemoglobin once during infancy, early childhood, late childhood, and adolescence.

Hemoglobin or Hemoglobin A1C for infants, pre-term infants born at less than 32 weeks gestation, and infants born at less than 1500 grams birth weight (excluding those born at term with severe birth trauma or as part of a twin birth). Hemoglobin A1C is also recommended at 9 months of age for children born at term with severe birth trauma or as part of a twin birth.

Tuberculosis (TB) screening by an Intradermal Mantoux (PPD) is done for children at 12 months.

Tuberculosis (TB) screening by an Intradermal Mantoux (PPD) is done for children at 12 months.

Immunization review and necessary updates are recommended at every visit because many infections can be prevented by childhood immunizations.

Hepatitis B, pneumococcal, Hib, meningococcal, and measles, mumps, and rubella (MMR) are recommended at 12 months.

In Alaska, newborn screening includes phenylketonuria, galactosemia, maple syrup urine disease, homocystinuria, biotinidase deficiency, and congenital adrenal hyperplasia.

The periodicity schedule represents minimum guidelines, additional populations or frequencies of screening may be appropriate.

Reference notes for Alaska, periodicity schedule for Child Health Screening
